a photomethods portfolio

was conducted at Pöyhry, approximately 100 km from the study site, where the following criteria were used to select the study sites: presence of public water, and groundwater flow of at least 100 m³ per day (Koski et al. 2002). Groundwater chemical analysis results showed that the water quality was good (total dissolved solids (TDS) < 100 mg/L) and suitable for drinking water.
